

1. Push(x) -> To push an element at the top.
2. Pop() -> Remove an element from the top.
3. Top() -> Display the element which is at the top.
4. Size() -> Size of the Stack.

Time Complexity -> $O(1)$
 Space Complexity -> $O(n)$

push(2)
 push(5)
 push(7)
 top()
 pop()
 push(100)
 top()
 pop()
 pop()
 size()
 pop()

Code

```
class Stack:
    def __init__(self):
        self.items = []

    def push(self, x: int) -> None:
        self.items.append(x)

    def pop(self) -> int:
        if len(self.items) == 0:
            return -1
        x = self.items.pop()
        return x

    def top(self) -> int:
        if len(self.items) == 0:
            return -1
        return self.items[-1]

    def is_empty(self):
        return len(self.items) == 0

    def size(self) -> int:
        return len(self.items)
