

Deque

Deque is preferred over because of the time complexities it gives is always even in any of the cases like inserting or popping at the zeroth index

Code

```
from collections import deque
```

```
lst=deque()
```

```
lst.append(1)  
lst.append(2)  
lst.append(3)  
lst.append(4)  
lst.appendleft(5)
```

```
print(lst)  
print(lst.pop())  
print(lst)
```
